SURFACE TEMPERATURES NOTE

Expect surface temperatures on body of fireplace to be at a maximum of about 120°-145°F. Temperature will vary with size or unit, vent run, and ambient temperature.

PAINTED FINISH

For a painted finish please ensure proper surface preparation is done prior to painting, including a high temperature joint compound and tape.

COMBUSTIBLE & NON-COMBUSTIBLE FINISHING

It is important that the facing material will NOT rest on the fireplace, this will cause bowing and issues removing the fireplace glass.

NON-COMBUSTIBLE FLUSH FINISH

It is important that the facing material will NOT rest on the fireplace, this will cause bowing and issues removing the fireplace glass.
**MANTELS AND SURROUNDS**

Combustible mantels may safely be installed over the fireplace provided that they do not project beyond the shaded area shown.

There are no restrictions on Non-combustible mantels providing they do not project beyond the facing material edge and interfere with glass removal, and the weight of the mantel is fully supported by the framing.

**A NOTE ON MANTELS & SURROUNDS**

National Canadian Gas Association mantel test requirements are for fire hazard prevention to combustible materials.

New technology, to meet consumer and government demands for the wise use of energy, has prompted us to manufacture many models of fireplaces which are hot, fuel and energy efficient.

Please be aware; temperatures over the mantel will rise above normal room temperature and walls above the fireplace may be hot to touch.

We recommend careful consideration be given to the effects of elevated mantel temperatures which may be in excess of product design, for example: candles, plastic, or pictures. This elevated heat can cause melting, deformation, discoloration or premature failure of a TV and radio components.
